AERO'SWEEP - ROAD SWEEPER ATTACHMENT

A product of [EMILY](#)

Emily has a new innovation: an angled brush sweeper without wheels. It's a unique sweeper on the worldwide market.

The AERO'SWEEP fits to telescopic handler, front loader and front linkage of a tractor and sweeps any type of materials. As distinctive feature the sweeper has no wheel which enables a perfect adjustment on uneven ground thanks to a hydraulic control (no action from the driver). The AERO'SWEEP works with one double acting spool (machinery handler). By setting the control device in one direction the brush is going down toward the ground and rotates. The brush stabilizes itself when it touches the ground in order to get a constant pressure on the brush. The constant pressure enables a perfect brush adjustment on uneven ground for an excellent sweeping. The brush is automatically adjusted when it wears out and thus requires no action from the operator. Thanks to the level mark the driver can control the brush positioning. By setting the control device on the other direction, the brush goes up: the user can carry and store the sweeper safely.
